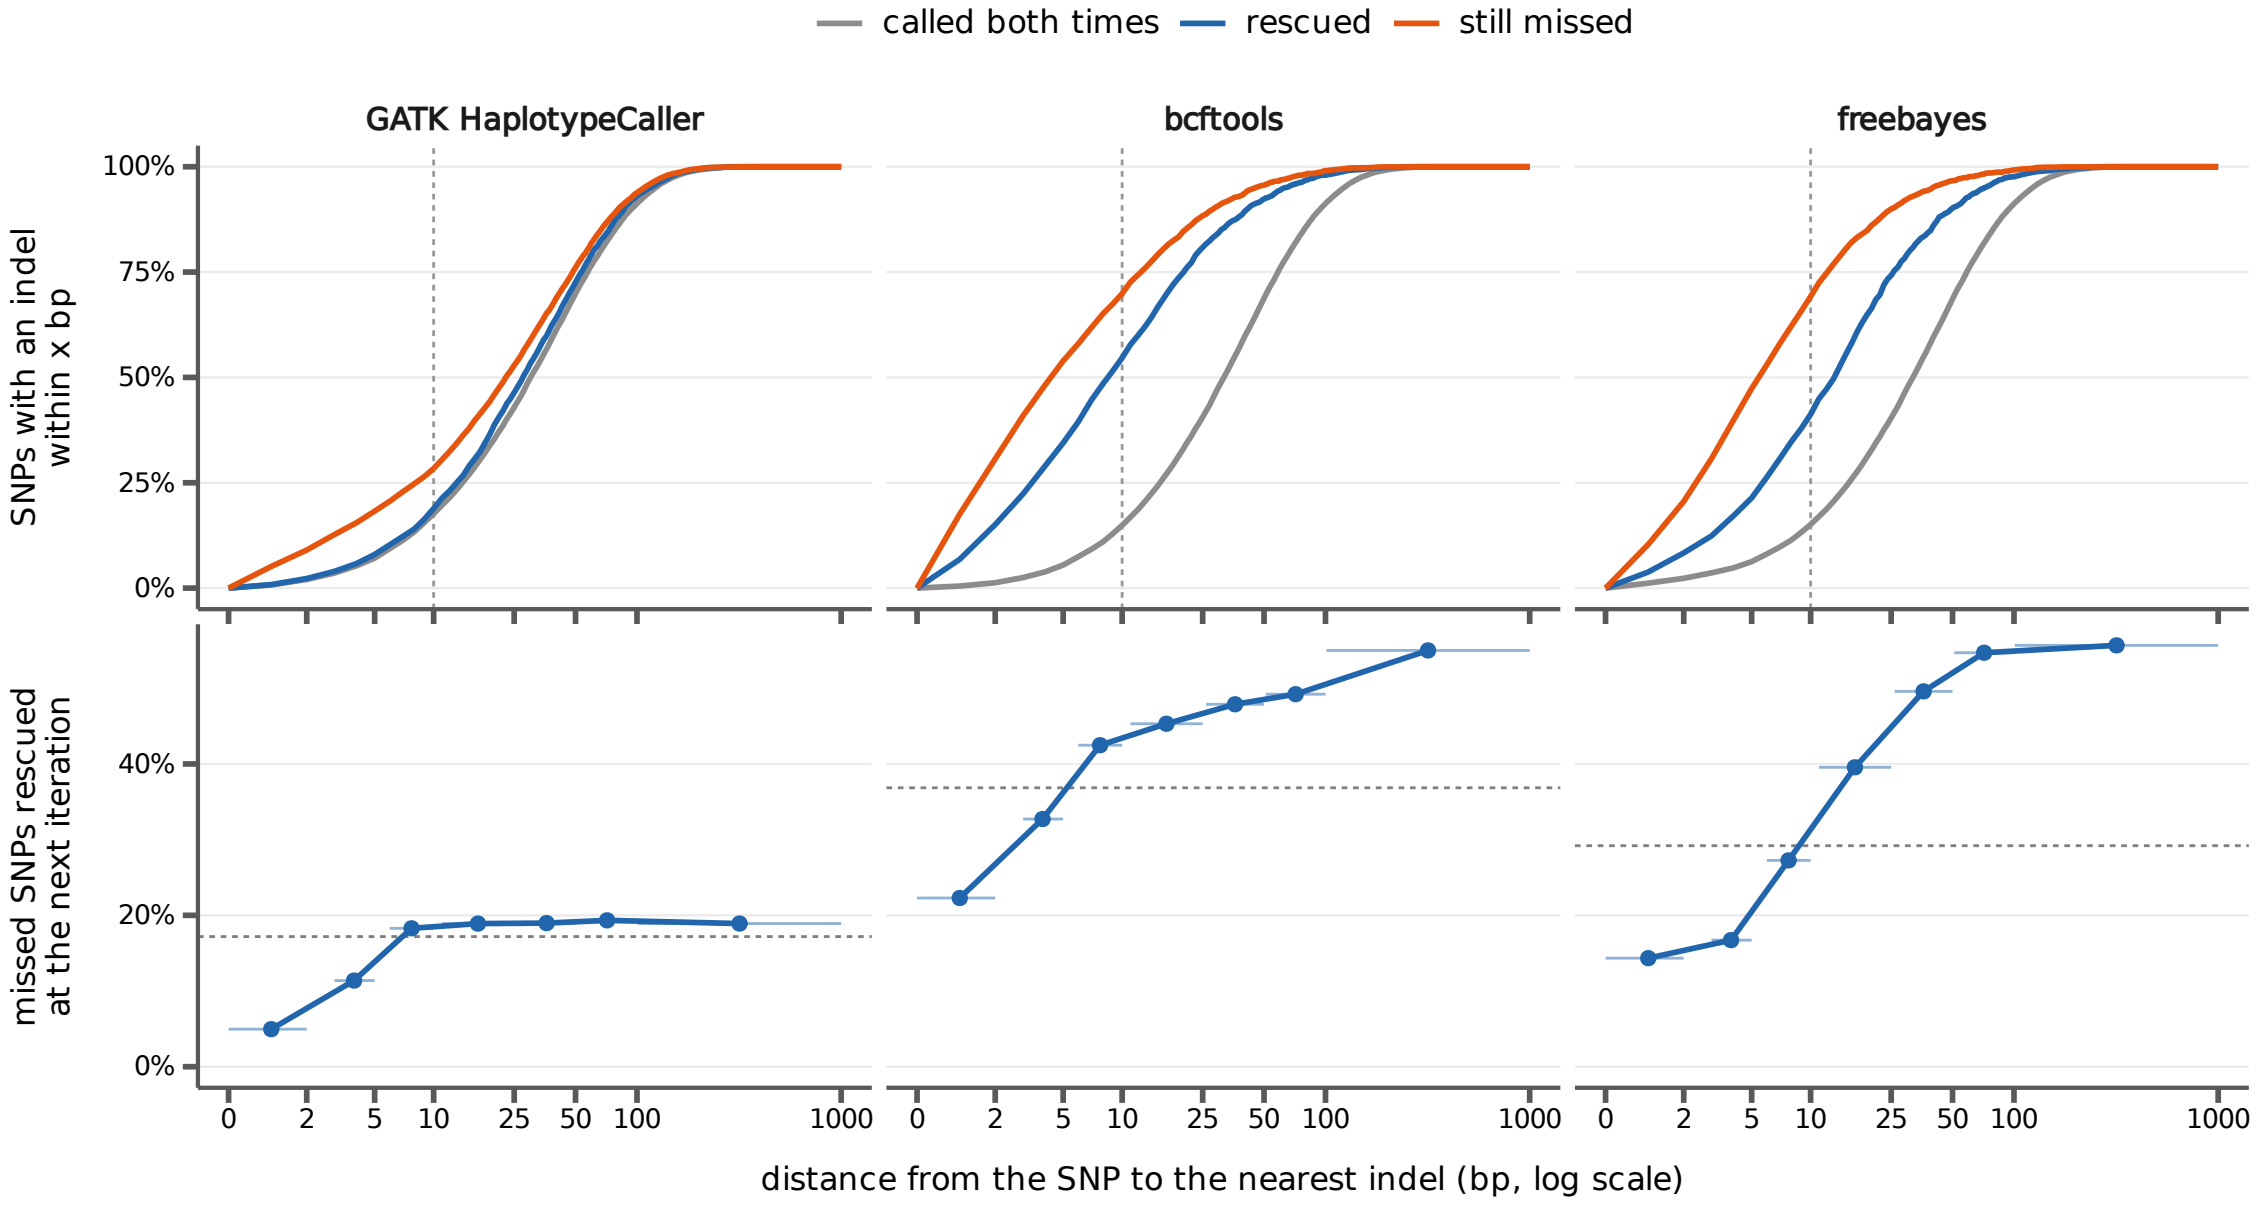
The closer an indel, the less likely a missed SNP is rescued

Top: how close the nearest indel is, by group (dashed line = the 10 bp cutoff in Fig 3C). Bottom: share of missed SNPs called one iteration later (dashed line = that caller's average rescue rate).



Data: s02 uniform SNP + indel simulation, D = 0.10; SNP-iteration pairs (1 → 2 and 2 → 3 pooled) as in Fig 3C. Distance = bp to the nearest truth indel (calling_metrics.py); distances above 1000 bp (or no indel nearby) plotted at 1000. Bottom bins (bars = bin span): 0–2, 3–5, 6–10, 11–25, 26–50, 51–100, >100 bp; SNPs per bin 97–5,632.
