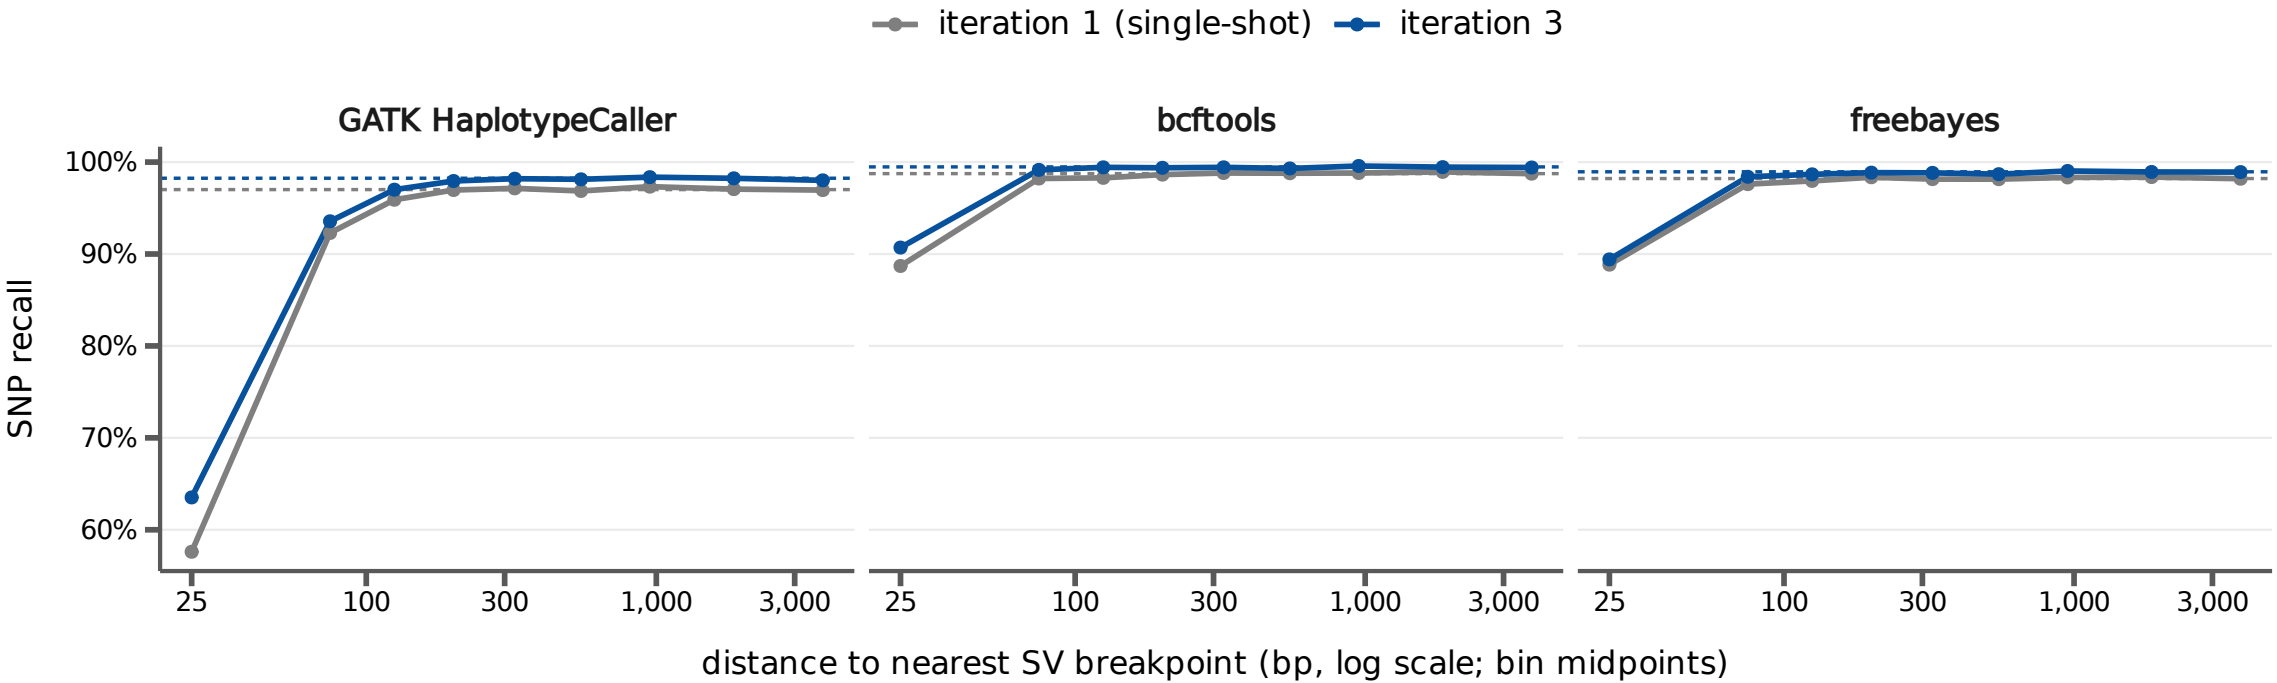
Structural variants: a local blind spot that iteration doesn't fill

SNP recall vs distance to the nearest SV breakpoint; dashed line = recall far (≥ 5 kb) from any SV.



Data: s07 SV simulation (none of the three callers calls SVs, so SVs are never written into the consensus).
Distance bin edges (bp): 0, 50, 100, 150, 250, 400, 700, 1200, 2500, 5000, then ≥ 5,000 (baseline).
