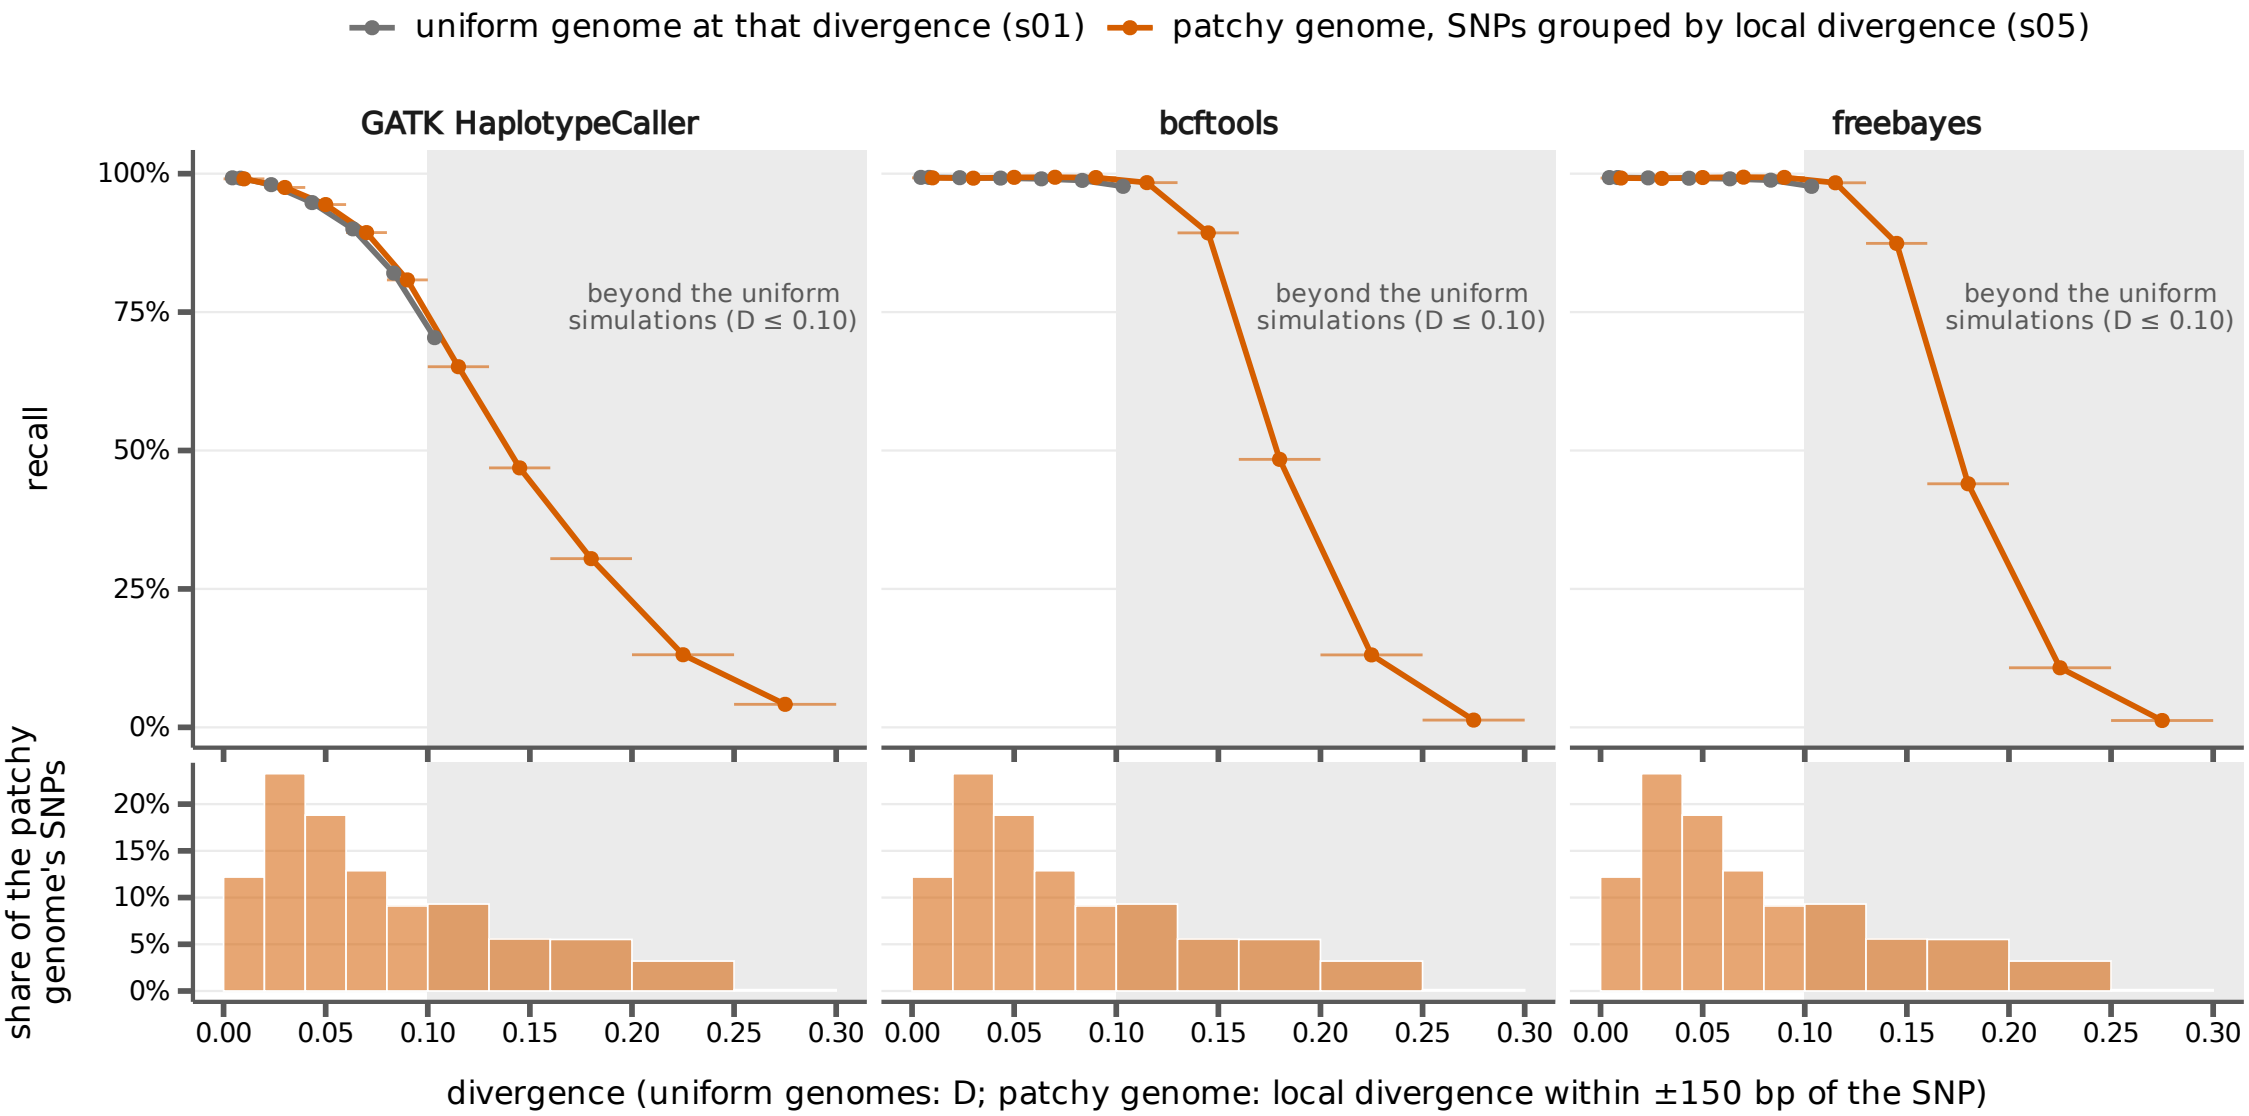
Each patchy region behaves like a uniform genome of its own divergence

Single-shot SNP recall. 24% of the patchy genome's SNPs lie in regions more diverged than 0.10 (grey zone), where recall falls steeply.



Data: s05 realistic field (mean D = 0.03, 20 kb correlation, local D capped at 0.20) and s01 uniform sims; mouse chr19, 30×.
Uniform points sit at D + 1/300, the average local divergence a site sees in a uniform genome. Patchy bins (bars = bin span): edges 0, 0.02, 0.04, 0.06, 0.08, 0.1, 0.13, 0.16, 0.2, bins with ≤ 500 SNPs dropped (0 SNPs). Bottom row: share of all 1,842,600 divergent SNPs in each bin (bins have unequal widths).
