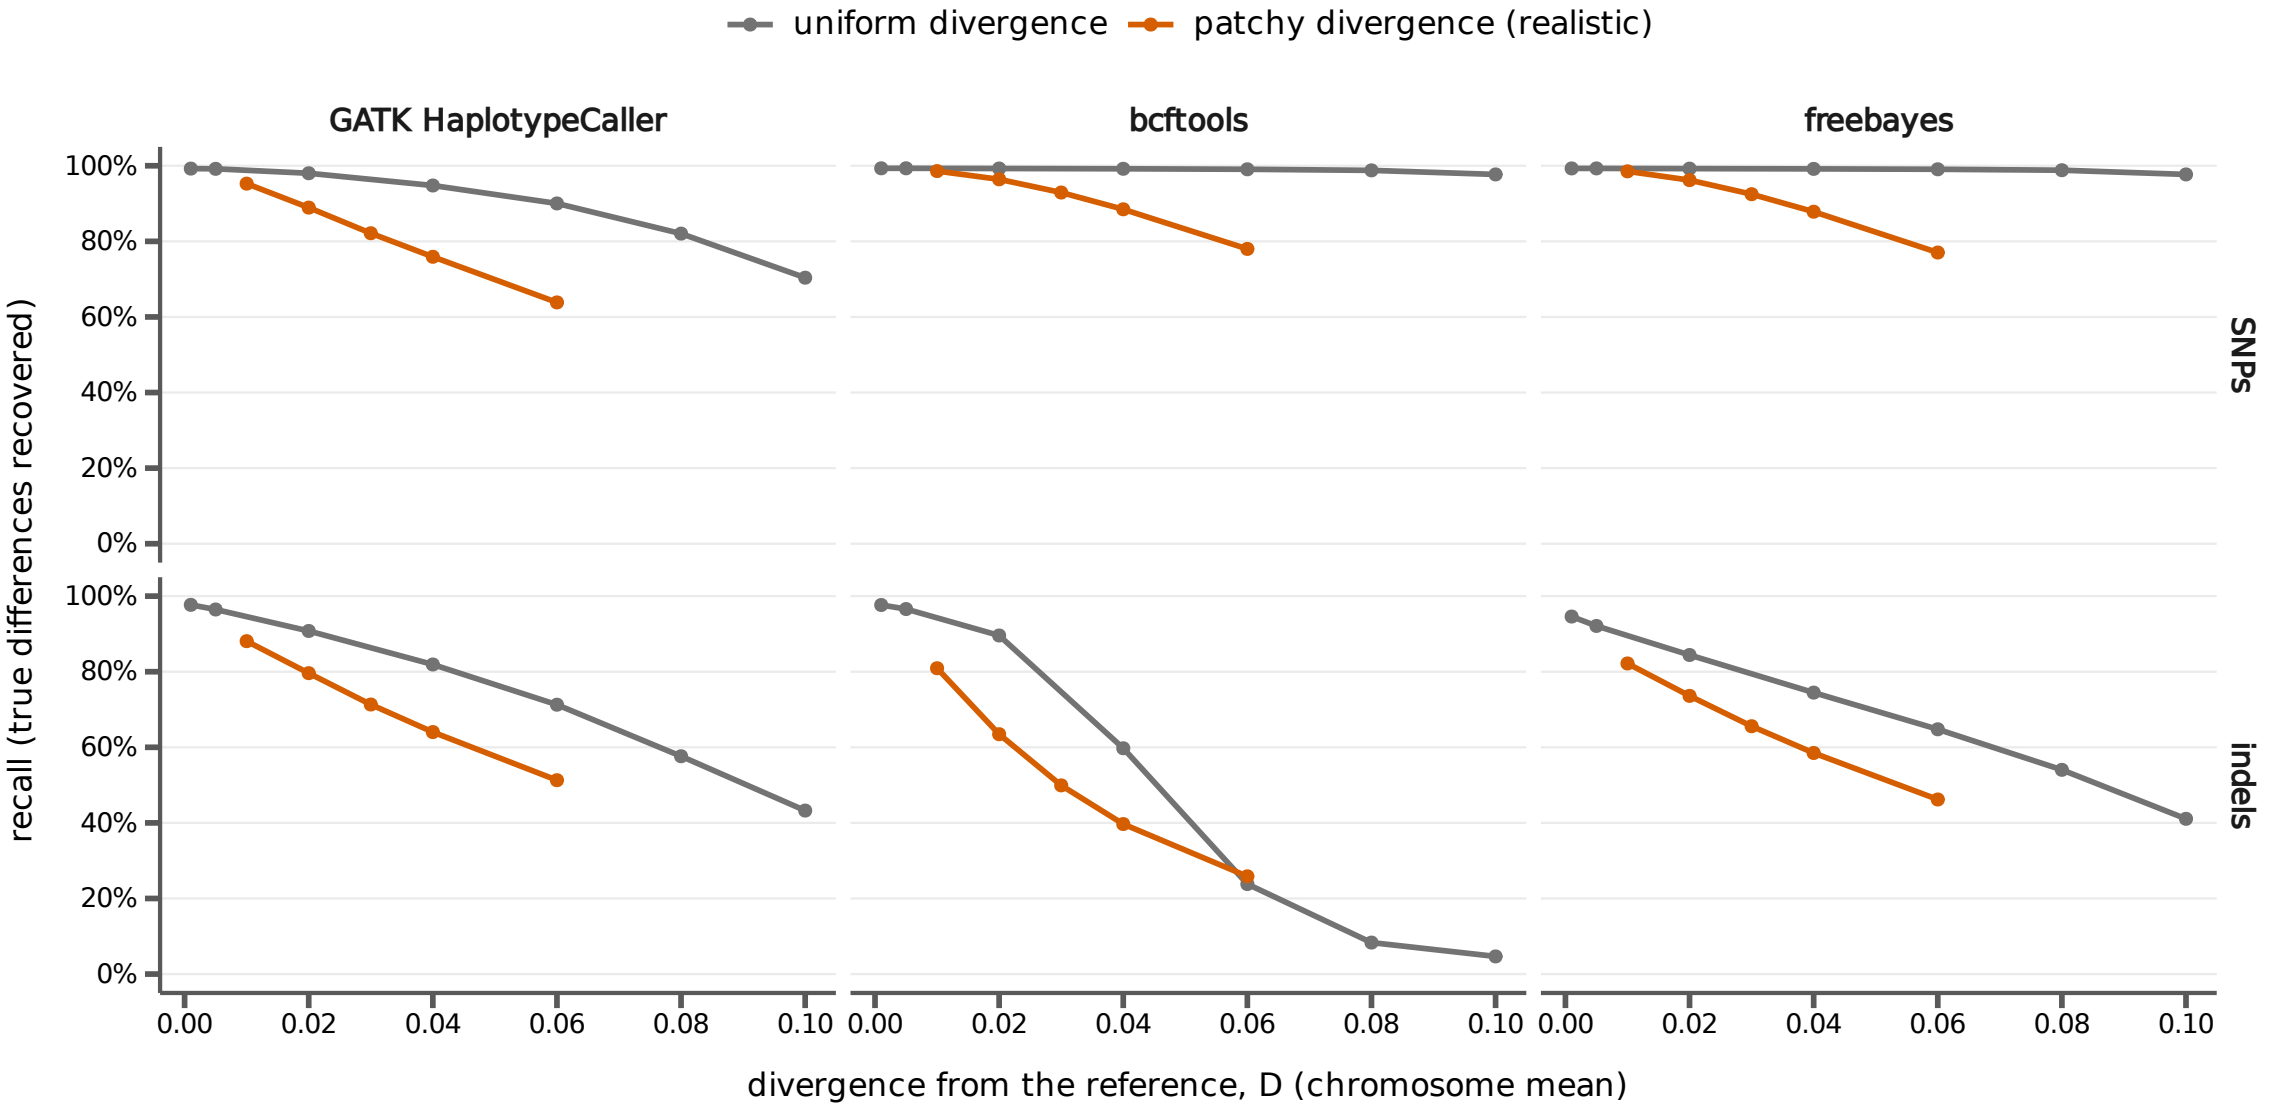
Reference bias: true differences are lost as divergence grows

Single-shot mapping (map once to the reference). Each point = one simulated chr19 genome.



Data: mason2 simulations of mouse chr19 at 30×; bwa mem; recall = recovered / true homozygous differences.
Uniform = s01 (SNPs, mean of 3 seeds) and s02 (indels); patchy = s05 realistic field (20 kb correlation, local D capped at 0.20).
